Our knowledge, your imagination. Powerful software.

# MailPort

### Product Description

MailPort, developed by RBRO Solutions, is a powerful product designed for the firm that is in the process of migrating their emails from another system to the Autonomy iManage WorkSite repository. However, firms that are already on WorkSite and import large volumes of email from other sources periodically will also find this a valuable resource.

### Dynamic Profiling

MailPort provides the ability to 'pre-profile' email prior to importing to WorkSite by extracting metadata from the folder structure and email properties, and then applies dynamic profile information to individual email or entire folders of email(s). The system provides options allowing the user to apply selected settings across multiple folders and subfolders without having to perform separate imports.

### Preview Profiles

This tool allows users to preview what the information in each email's profile will look like, for your entire import, prior to importing a single email.

### Data Collection

The data collection in MailPort can be done using a .pst file or directly from your exchange account.

### Import Options

Bind WorkSpaces based on metadata provided or bind to

a specific folder, WorkSpace, or tab.

### Multiple Sessions

Run multiple import sessions simultaneously per WorkSite library.

### Folder Structures

Users do not need to worry about losing their carefully built folder structures organizing their emails. MailPort can build your current folder tree or matter structure into WorkSpaces and folders.

### Enterprise Mail Migration System

MailPort, run by the firm Administrator, provides import functionality for transferring external email into the WorkSite Document Management System. MailPort includes options for dynamic profiling, security, and the creation of WorkSpaces and folders.
